Biochemistry 26:4668-4674(1987).
-i- FUNCTION: C4BP CONTROLS THE CLASSICAL PATHWAY OF COMPLEMENT ACTIVATION. IT BINDS AS A COFACTOR TO C3B/C4B INACTIVATOR (C3BINA), WHICH THEN HYDROLYZES THE COMPLEMENT FRAGMENT C4B. IT ALSO ACCELERATES THE DEGRADATION OF THE C4BC2A COMPLEX (C3 ALSO ACCELERATES THE DEGRADATION OF THE C4BC2A COMPLEX (C3 ALSO ACCELERATES THE DEGRADATION OF THE C4BC2A COMPLEX (C3 ALSO ACCELERATES) BY DISSOCIATING THE COMPLEMENT FRAGMENT C2A. ALPHA CHAIN BINDS C4B. IT INTERACTS ALSO WITH SERUM ANYLOID P COMPONENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                C4BP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         60 PPPAIPNALPASDVNRTDFESHTTLKYECLPGYGRGISRMMYYCKPSGEW-EIS-VS-CA 116
    FUNCTION: CA(2+) - DEPENDENT RECEPTOR FOR MYELOID CELLS THAT BINDS
TO CARBOHYDRATES ON NEUTROPHILS AND MONOCYTES. MEDIATES THE
INTERACTION OF ACTIVATED ENDOTHELIAL CELLS OF PLATELETS WITH
LEUKOCYTES. THE LIGAND RECOGNIZED IS SIALY:-LEWIS X.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: EXPRESSED IN ALL TISSUES EXAMINED: SPLEEN,
LING, BRAIN, LIVER, HEART, KIDNEY, THYMUS, SMALL INTESTINE.
INDUCTION: ACUTE INFLAMATION (PROBABLY).
SIMILARITY: TO OTHER SELECTINS/LECAMS.
SIMILARITY: CONTAINS 1 C-TYPE LECTIN FAMILY DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Local

TO CARBOHYDRATES ON NEUTROPHILS AND MONOCYTES. MEDIATES THE
INTERACTION OF ACTIVATED ENDOTHELIAL CELLS OR PLATELETS WITH
LEUKOCYTES. THE LIGAND RECOGNIZED IS SIALYL-LEWIS X.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: STORED IN THE ALPHA-GRANULES OF PLATELETS
AND WEIBEL-PALADE BODIES OF ENDOTHELIAL CELLS. UPON CELL
ACTIVATION BY AGONISTS, P-SELECTIN IS TRANSPORTED RAPIDLY TO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A42755; A42755.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   THE CELL SURFACE

THE 66 KD ALPHA ISOFORM AND THE 56 KD BETA ISOFORM FOUND IN ALL TISSUES EXCEPT SPERM CORRESPOND TO THE TRANSCRIPTS C AND D, AND THE TRANSCRIPTS E AND F RESPECTIVELY. THE EXON 9 IS SPECIFICALLY DELETED IN SOME PLACEMYAE. THE EBSILON ISOFORM CORRESPONDS TO THE TRANSCRIPTS I AND J. SPERMATOZOA DELTA ISOFORM (TRANSCRIPT N) DELETE BOTH EXONS 12 AND 13. ALL TISSUES DIFFERENTIALLY SPLICE EXON 13.

TISSUE SPECIFICITY: EXPRESSED BY ALMOST ALL CELLS EXCEPT ERYTHROCYTES AND SOME BONE MARROW CELLS.

FUNCTION: BINDS TO VARIOUS KINDS OF NEGATIVELY CHARGED SUBSTANCES SUCH AS HEPARIN. PHOSPHOLIPIDS, AND DEXTRAN SULFATE. MAY PREVENT ACTIVATION OF THE INTRINSIC BLOOD COAGULATION CASCADE BY BINDING TO PHOSPHOLIPIDS ON THE SURFACE OF DAMAGED CELLS.

TISSUE SPECIFICITY: PLASMA.

SIMILARITY: CONTAINS 4 SUSHI (SCR) REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunol.

Human complement factor H homolog protein.
Human complement factor H; immunological mechanism; complement reaction;
gene therapy; immune stimulation; haematopoissis regulation; chemotactic;
tissue growth activity; anti-inflammatory; tumour inhibition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 H related antigen, or nucleic acid encoding it
Example 6B; Fig 6B; 104pp; English.
This partial protein is found in clone prabbr#410 and represents a complement factor H related protein with homology to a region of the human tumour associated complement factor H (CFH). The detection of this protein and a CFH antigen can be used in screening or for the treatment of renal or urogenital cancer, e.g. bladder, cervical or prostate cancer. Agents that may modulate this antigen could be used in the manufacture of a medicament for the treatment of a tumour cell.

The protein can also be used as an antigen for preparing antibodies against the protein. The cDNA can be used as a probe for gene diagnosis and the gene for gene therapy, as well as for large-scale expression of the protein. The protein may also have immune stimulating or suppressing activity, haematopoiesis regulating activity, tassue growth activity, activin/inhibin activity, anti-inflammatory activity, tumour inhibition activity, chemotactic/chemokinetic activity, receptor/ligand activity, etc. The protein is identified by the presence of a hydrophobic N-terminal secretory signal region, knowledge of the protein function is not required, as in e.g. methods of expression
                                                                                                                                                                                                      region
                                                                                                                                                                                                                                                                              region

CC Distance of Fig 1; 105pp; English.

CC obtained following PCR amplification. The protein is a monomer CC containing 8 SCRs. Each SCR forms a looped domain due to the presence of two intradomain disulphide bonds (only the disulphide bonds of SCR8 are labelled in the Features Table). Within each SCR, CC the first cysteine residue bonds with the third and the second CC systeine residue bonds with the fourth. This secondary structure is CC responsible for the conformational flexibility of the C4bp monomer. CC or a specified subfragment of it, e.g. having 5, 4, 3 or 1 SCR(s) CC is fused to the C-terminal of a protein such as a viral receptor, CC cell ligand, a bacterial, viral or parasitic immunogen, enzyme, CC cytokine, toxin, etc. See also Q13243-51.

This sequence is used in the identification of complement factor H related proteins and antigens from clone prassprey210 (see w3915.7-w39159). The detection of this protein and a CFH antigen can be used in screening or for the treatment of renal or urogenital cancer, e.g. bladder, cervical or prostate cancer. Agents that may modulate this antigen could be used in the manufacture of a medicament for the treatment of a tumour cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   inflammatory responses such as rheumatoid arthritis
Disclosure; Fig 1, 54pp; English.
This is an amino acid sequence of the human soluble complement receptor 1 (SCR1), useful in the treatment of T-cell or B-cell mediated immune responses. It is used to inhibit a T-cell or B-cell-mediated immune response to prevent immune response-mediated tissue rejection and destruction or clearance or inactivation of an expressed protein especially from cells that have been treated by gene therapy to express the protein, e.g. dystrophin. The protein can also be used to inhibit a T-cell or B-cell-mediated inflammatory response,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       30-JUN-1998 (first entry)

PS Claim 22; Pages 60-61; 75pp; English.
CC This sequence represents human complement receptor 1 (CR1, CD 35)
CC This sequence represents human complement receptor 1 (CR1, CD 35)
CC N-terminal fragment. The invention relates to a soluble derivative (A)
CC of a soluble polypeptide (I), which comprises at least 2 heterologous
CC membrane-binding elements (MBE) of low membrane affinity covalently
CC associated with (I). MBE interact, independently and with thermodynamic
CC additivity, with components of cellular or artificial membranes exposed
CC to extracellular fluids. (A) are used to treat disorders treatable with
CC (I) itself, specifically inflammation or any other complement-related
CC disorder (e.g. neurological disease, graft rejection, myocardial
CC inflarction, sepsis, rheumatoid arthritis and many others; including
CC application to indwelling devices) and thrombolytic disease, but also to
CC treat allergy, induce weight loss, to treat ischaemia or asthma and as
CC immuno-modulators for treating multiple scierosis. (A) are administered
CC orally, topically, by injection or inhalation at 0.01-10 (preferably
CC 0.1-10) mg/kg/day.

In the sequence, x-untranslated region. This has 7 short consensus repeats (CR) of 4 long direct homoLogous repeats (LHR) (see fig. 10 in patent). Deletion mutants, eg LHR-A for binding of C4b, and LHR-C for C3b binding, be made, and LHR-B and -C can detect CR2 sequences. They are useful in diagnosing and treating immune disorders, and prevent
                                                                                                                                                                                                                                                                                                                                                                                                                               Partial human complement type 1 receptor. complement system; C3b/C4b receptor; CR1; allergic reaction;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      perfusion injury

Each LHR might represent a single C3b/C4b binding domain, making the receptor multivalent. The LHR's are composed of 7 short consensus repeats of 60-70 residues resembling the SCR's of other C3/C4 binding proteins. The protein and fragments of it having C3L and/or C4b binding activity can be used to treat immune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  fragments - for treatment of immune disorders, myocardial infarct, damage due to inflammmation and in treatment of thrombosis Disclosure; Fig 5; 234pp; English.
